

Uploading Images to LeadsOnline

v.20160325

Uploading your store software images

There are two ways to upload images:

1. LeadsOnline website: www.leadsonline.com (instructions below) – uploading images using the website requires that the associated ticket number and ticket date for each image be known prior to the upload process.
2. FTP – LeadsOnline accepts SFTP security (instructions below)
 - a. Before uploading, all image files must be named according to the naming convention outlined in the **Naming conventions for uploading** section below.
 - b. Each image can be its own file or they can be compressed into a zip file and the zip file uploaded.
 - c. Acceptable image extensions / formats: **JPG – JPEG (can also be JPE or JPEG), GIF, or PNG**. A **PDF** file is an acceptable format for **D** type (document) images only (see **File Name** under the **Naming conventions for uploading** section).

Uploading via leadsonline.com

Uploading Images Individually

After logging into the LeadsOnline website, click on **Enter Transactions** from the menu, then click on the **Ticket Attachments** tab and then click on your store name. From here, follow the on-screen instructions to enter the ticket date and number and select the type of image. Click the **Browse to Upload** button, locate the desired image file and then click **Open**. Once a transaction is submitted to LeadsOnline with the corresponding ticket number and ticket date, the image will attach to the ticket.

Uploading Multiple Images or Image .zip File

NOTE: Before proceeding, make sure each image is named using the proper naming conventions as outlined in the section titled **Naming conventions for uploading**. Failure to rename the images properly will cause them to not sync to a ticket, and thus, not be viewable. Once the images are renamed, they can be uploaded individually or compressed into a zip file and the zip uploaded; either way using the following procedure:

After logging into the LeadsOnline website, click on **Enter Transactions** from the menu, then click on the **File Upload** tab and then click on your store name. Click the **Browse to Upload** button, locate the desired image file(s) or zip file and then click **Open** to perform the upload.

Uploading via FTP

You can use any FTP client to upload through our secure FTP server at: <ftp.leadsonline.com>.

Please note the following:

- a. FTP login ID and password are case-sensitive and should always be all lower-case.
- b. Initially, your FTP login username and password will mirror your website login credentials, with the FTP login being all lower case. If/when you reset your LeadsOnline password, your FTP credentials should not be affected.
- c. We strongly encourage using an FTP client that supports SFTP and encrypts your transmissions.

If you need help with FTP or you're ready to transfer your first file, contact our support team at (800) 311-2656 or email storesupport@leadsonline.com.

Naming conventions for uploading

Image file names must be named so they can be identified independently of the data file containing the corresponding transaction. There are two types of images: **transaction images** and **item images**.

Transaction Images

a. **Description**

Transaction images are associated with a transaction rather than an item in the transaction. In general, they will include customer images, fingerprints, vehicles containing the items, etc.

b. **File name structure**

IMG_<picture-code>_<leads-store-ID>_<transaction-date>_<transaction-number>_<picture-ID>.<extension>

Example: *IMG_CPY_1925_20070402_4235_001.jpg*

Note: For uniqueness, multiple transaction images are designated by incrementing or using the store software internal picture ID for the <picture-ID> portion of the file name.

Item Images

a. **Description**

Item images refer to images of specific items. While an image may include pictures of other items, it must be central to the identification of the item with which it is associated.

b. **File name structure**

IMG_<picture-code>_<leads-store-ID>_<transaction-date>_<transaction-number>_<item-number>_<picture-ID>.<extension>

Example: IMG_APY_1925_20070402_4235_1_001.jpg

File Name

The individual components of the file names are described below:

1. **<picture-code>**

3-letter code which identifies picture detail.

First letter designates the classification of the image:

- C – Customer image (Example: CSY)
- I – Customer ID image (Example: INY)
- T – Customer thumbprint image (Example: TNY)
- S – Customer signature (Example: SNY)
- V – Vehicle image (Example: VSY; for scrap yards only)
- L – Vehicle license/tag image (Example: LBY)
- D – Scanned document (Example: DAB) – **may be a .pdf file**
- A – Article image (Example: AAY; includes pawned vehicles)

Second letter designates the camera position, if known:

- A – Camera positioned directly above (Example: AAY)
- B – Camera positioned from behind (Example: CBY)
- D – Camera positioned from left/driver side (Example: VDY)
- F – Camera positioned from front (Example: CFY)
- N – Camera position is not supplied or not applicable (Example: INY)
- P – Camera positioned from right/passenger side (Example: VPY)
- S – camera positioned from unspecified side (Example: VSY)

Third letter designates the transaction type, if known. This must exactly match the type supplied in the data file:

- B – Buy transaction
- P – Pawn transaction
- T – Trade transaction
- Y – Unknown transaction type

2. **<leads-store-ID>**

Internal number that uniquely identifies the business uploading to us. LeadsOnline supplies this number to the store.

3. **<transaction-date>**

Date the transaction occurred. Timestamp should not be included. The format for this field is YYYYMMDD.

4. **<transaction-number>**

EXACT number that appears in the data file. This is alpha numeric, so if leading zeros are present in the data file's transaction number, they must also be present in the image file name.

5. **<item-number>**

Field is required for item images but omitted for customer/transaction images. This represents the item sequence number of the transaction. This must match the contents of the item number field in the data file exactly. If leading zeros are present in the data file's item number, they must also be present in the file name.

6. **<picture-ID>**

Ensures uniqueness if there is multiple images for the same picture-code for a given transaction or item. We suggest using the software's internal picture ID for this field.
